

# TerraMax MicroPT™

## Pit and Lagoon Treatment

- Liquify Solids to Prevent Build Up
- Reduce the Levels of Odor Causing Compounds
- Establish Desired Microbial Strains for Optimal Treatment of Animal Wastes
- Lower Ammonia Content

### Directions for Use:

Store in a cool place. Shake well before using. For best results empty pit prior to initial application. Use 1 gallon per 100,000 gallons waste capacity.

MicroPT™ should be mixed as best as possible in the pit or lagoon. This can be accomplished by mixing the desired amount of MicroPT™ in a five gallon pail adding water and pouring the mixture at several spots into the pit or lagoon.

As an example, a pit approximately 400,000 gallons in size using conventional waterers and feeders that will pump out once a year apply 1 gallon (for easier measuring) of MicroPT™ after pump out. Then apply this same amount at three-month intervals. For example if the pit was pumped on October 1st apply 1 gallon of MicroPT™ to the empty pit. On January 1st add the next batch of MicroPT™. Repeat in April and July.

For additional information please contact your local TerraMax Distributor.

### For best results when using MicroPT™

- Empty pit before beginning application
- After diluting the MicroPT™ with water disperse the mixture as thoroughly as possible into the pit.
- For conventional waterers and feeders split apply even amounts at three month intervals.
- For wet/dry feeders split apply even amounts at two month intervals.
- Pits that have solids build up will take time to digest the solids and bring the pit back optimum function.
- Excessive solids build up may result in crusting as the microbial digestion process gets underway.
- Pits with excessive solids build up may need to be "jump started" with a larger dose of MicroPT™

### CAUTION:

#### KEEP OUT OF REACH OF CHILDREN
